

BRECO[®], BRECOFLEX[®] timing belts

Keeping things moving!

Innovation is our drive - this principle marks BRECO Antriebstechnik Breher GmbH & Co., manufacturer of BRECO® and BRECOFLEX® timing belts as the most innovative producer in the field of polyurethane timing belt technology worldwide. The basis for a high-quality and reliable product is provided by wear resistant polyurethane for the belt body and high tensile steel cord tension members.

The name BRECO became the synonym for polyurethane timing belts resulting from years of experience in the field of thermoplastic polyurethane, the development of BRECO® and BRECOFLEX® manufacturing processes and their further development. The BRECO® and BRECOFLEX® timing belts, the pulleys designed to match them perfectly, and other components supplied by BRECO reflect the breadth of experience gathered over decades by countless people who have used the products. We maintain a consistently high level of quality through our exclusive use of high-quality materials and by listening to feedback from our suppliers about the needs of our customers.

One strong point is the development and production of special belts for various application fields. The large number of belt coatings and the most varied shape of flights open up an extremely broad application field for BRECO® and BRECOFLEX® timing belts. We stock a broad range of belt and tension cord materials to cater for applications in very cold or very hot environments.

In simple applications too, BRECO® timing belts offer all the advantages and quality expected of a high-end branded product. Safety, durability, accuracy and availability are some of the benefits which ultimately have a positive impact on costs.

All our products conform to the European RoHS Directive which restricts the use of hazardous substances.

Staying safely on the move.

Construction

BRECO®, BRECOFLEX® timing belts are manufactured of wear resistant polyurethane and high tensile steel cord tension members. Both high quality materials combined form the basis for dimensionally stable and high resistance polyurethane timing belts. Polyurethane timing belts have a very high span rigidity. No post-elongation of the tension members is to be expected in continuous operation. Only under extreme load and after a short run-in time, the pre-tension of the belts might slightly reduce by the tension members settling, making a once-only re-tensioning of the timing belt unavoidable.

The timing belts are temperature resistant with ambient temperatures from -30°C to +80°C. Applications close to the limit temperatures (<-10°C and >50°C), however, might require adapted dimensioning. For specific temperature ranges various belt materials are available. Please contact our distribution partner for this type of application.

The production methods according to which BRECO®, BRECOFLEX® timing belts are produced, allow keeping within tight tolerances which guarantee a uniform load distribution during power transmission. These polyurethane timing belts are suitable for the transmission of high torques as well as the precise positioning and transport of various goods.

Properties

Mechanical

- Positive fit, synchronous run
- Constant length, no post-elongation
- Low noise
- Wear resistant
- Low-maintenance
- Highly flexible
- Positional and angular accuracy
- Can be crossed (see chapter „Angular drives“)
- Fatigue resistant, low extension steel cord tension members
- Beltspeed up to 80 ms⁻¹
- Small build sizes
- Favourable power-to-weight ratio
- Low pre-tension
- Low bearing load
- Permits large centre distances
- Permits large transmission ratios
- High degree of efficiency, max. 98 %

Chemical:

- Hydrolysis resistant
- Resistant to aging
- Temperature resistant from -30° to +80°C (see information in the text „Construction“)
- Tropical climate resistant
- Resistant against simple oils, fats and petrol
- Resistant to some acids and lyes

For special areas of use we can produce all types of timing belts in materials, whose properties make it possible, to use belts in following areas:

- Foodstuff sector (TPUFD)
- Low temperature range from -30°C to +5°C (TPUKF)
- High temperature range from +20°C to +110°C (TPUWB)
- Use in low aggressive environment (TPUAU)

As alternative to the standard steel cord tension members, tension members in stainless steel and aramide are available. In the case of strong bending stress resp. tension load, timing belts with high flexible tension members (E) resp. with reinforced tension members could be produced.

For further information about the resistance of polyurethane timing belts and available belt materials as well as alternatively tension member materials please contact our distribution partner.

AT high capacity profile

Further development of the T profile resulted in the AT profile. This type of belt is characterised by the larger tooth shear strength resulting from the larger tooth volume and the stronger tension members.

Further advantages:

- Favourable tooth mesh
- Strengthened tension members for constant pitch
- Improved performance up to 50 % as compared to the T profile
- Precise transmission of movement in conjunction with synchronous pulleys with reduced or zero backlash
- Reduction of meshing impacts or shocks

AT

AT in DL version

The DL timing belt (the belt is double-sided) is applied in the power transmission and transport technology.

Multiple-shaft drives with different rotational directions can be realised with this timing belt. Full loadability on both tooth sides.

AT-DL

Curved teeth

As a logical consequence of the demand for reducing running noise, a profile was developed which does without the conventional polygon effect. In addition to smooth running, the profile has, in comparison to the AT, a larger tooth face and is self-guiding in the preferred running direction.

Preferred use:

- Special demands regarding smooth running properties and transmission precision
- Tight assembly dimensions
- Transport and transmission tasks

BAT

Curved teeth with guiding track

The BATK has ensued from the BAT. The timing belt is self-tracking in both running directions due to the integrated guiding track.

Preferred use:

- Special demands regarding smooth running properties and transmission precision
- Applications in the field of the linear and power transmission technology
- Tight assembly dimensions

BATK

ATP

ATP high capacity profile

Further increased performance, noise reduction and extension of the belts useful life led to the development of the ATP timing belt. The basic concept of the ATP profile provides the division of the trapezoidal tooth into two individual and load bearing teeth. Performance increase up to 60 %, running noise reduced by up to 10 db(A) and an increased longevity by:

- Tooth surface area increased by 70 %
- Uniform load/tension distribution
- Improved power dispersion
- Reduced polygon effect
- Small construction width
- Optimised tooth mesh

ATN

ATN

The ATN timing belt is especially designed for the application in the transport technology. The flight fastening system in the belt tooth permits fast fitting and replacement of the flights individually manufactured for the conveying application concerned.

ATN with V-groove

ATN with V-groove

The ATN timing belt is especially designed for the application in the transport technology and applied where no flanges on the pulleys and other guiding elements are possible for constructional reasons.

SFAT

Offset teeth

AT performance profile with two toothed tracks with a belt designed as SFAT. These toothed tracks are offset by half a tooth pitch in relation to each other. In combination with the accompanying synchronous pulleys, the SFAT is self-guiding. No flanges are required.

Preferred use:

- Running on synchronous pulleys without flanges
- Where low noise is of the essence (reduced polygon effect)

Self-tracking belts

Self-tracking belts are a combined construction of synchronous belts and V-belts with straight running characteristics. The performance range is that of the standard T or AT profiles minus the non toothed belt width.

Preferred use:

- Where large lateral forces apply
- Running on synchronous pulleys without flanges

(Also available in TK-version)

ATK

Standard profile

The timing belt with a trapezoidal profile according to DIN 7721 is regarded as the classical standard timing belt.

Preferred use:

- For standard drive tasks
- For high bending stress

(Also available in DL-version)

T

Imperial profile

Imperial pitches according to DIN/ISO 5296 are available in the following sizes:

- XL = 5,000 mm
- L = 9,000 mm
- H = 12,000 mm
- XH = 22,000 mm

Preferred use:

- Applications in imperial units

Imperial

Available versions

Version Standard

Standard version, single-sided

The standard version of the BRECO® and BRECOFLEX® timing belt is a combined construction of the two materials: wear resistant polyurethane and high tensile steel cord tension members. The standard version is universal applicable for all tasks in the drive and conveying technology.

Ordering code: without

Available for all pitches

Version DL

Standard version, double-sided

The standard version of the double-sided BRECO® and BRECOFLEX® timing belts is a combined construction of the two materials: wear resistant polyurethane and high tensile steel cord tension members. Full loadability on both tooth sides. The standard version of the DL timing belts are universal applicable for all tasks in the drive and conveying technology.

Ordering code: DL

Available for:
AT5-DL only BRECOFLEX®, AT10-DL only BRECOFLEX®, T5-DL, T10-DL, T20-DL, H-DL only BRECOFLEX®, ATK10K6-DL only BRECOFLEX®, AT20DL only BRECOFLEX®

Version DR

Standard version with reinforced belt back

The timing belt in version DR has in comparison with the standard version a thicker belt back.

Ordering code: DR

Available belt types see product range

Version T

Standard version with transport coating

The timing belt in version T has in comparison with the standard version a transport coating, thickness 1.5 mm (T5, AT5) resp. 2 mm (T10, T20, AT10 AT20, Imperial timing belts), which is extruded on the belt back. The timing belt in version T is universal applicable for all tasks in the conveying technology.

Ordering code: version T

Available belt types see product range

Available versions

Version PAZ

Nylon tooth facing

The belt base corresponds the standard version. An additional nylon tooth facing causes a lower friction coefficient, lightens the tooth mesh in the pulley and reduces noise. Transport belts on bed plates running easier and are wear resistant.

Ordering code: PAZ

Available for all pitches but T2,5

Version PAR

Nylon facing on the back of the belt

The belt base corresponds the standard version. An additional nylon tooth facing causes a lower friction coefficient. Application area in the conveying technology: e.g. for accumulation conveyor (back of the belt runs easier and is wear resistant).

Ordering code: PAR

Ordering code: PAZ-PAR (both sides coated)

Available for all pitches, only BRECO M and V, but AT3 and T2,5

Version DL-PAZ

Nylon facing on double-sided belts

The belt base corresponds the double-sided standard version. An additional nylon tooth facing causes a lower friction coefficient, lightens the tooth mesh in the pulley and reduces noise. Transport belts on bed plates running easier and are wear resistant.

Ordering code: PAZ (coating only possible on inner side)

Available for
AT5-DL only BRECOFLEX®, AT10-DL only BRECOFLEX®, T5-DL, T10-DL, T20-DL, T1/2"-DL only BRECOFLEX®

For further information about the resistance of polyurethane timing belts and available belt materials as well as alternative tension member materials please contact our distribution partner.

Highly flexible tension inserts - the E steel cord tension member

The thinner the single wire, the more flexible the overall tension member! This interrelation led us to develop BRECO® and BRECOFLEX® timing belts with E tension members.

In the E tension member the tension member cross-section is distributed to a lot more thin individual wires and, therefore, the bending fatigues are markedly lower in the individual wires. The advantage of the E tension members is a higher flexibility.

This is especially important, when smaller mounting dimensions for pulleys and tension rollers are required. The minimum number of teeth and/or minimum diameter of the pulleys can be fallen below up to 30% compared with standard tension members.

Timing belts with E tension members are recommended for multi-shaft drive with frequent bends.

Application informations: For intended application under extreme conditions please contact our technical department for advise.

Steel cord tension members (Example):

The thinner the individual wire the more flexible the whole timing belt.

Summary:

- Thinner individual wires in the steel cord
- Higher dynamic capabilities
- Extremely high bonding and bending fatigue strength
- Smaller pulley and tension roller diameter
- No correction of the synchronising pulleys are necessary

Notes:

- AT3 (standard), ATL5 (standard)
- Belt lengths respectively to the delivery range
- Synchronising pulleys respectively to the delivery range
- Calculation analog to the standard tension member
- For deliverable types refer to delivery programme

The special characteristics

- Increased tooth load resulting from the tooth curve
- Clearly reduced running noise due to a time elongated tooth mesh
- Higher power transmission precision and lower vibration tendency due to a reduced polygon effect
- The BAT is self-guiding in the preferred running direction, no flanges are required
- The BATK is self-guiding in both running directions due to the integrated guiding track making flanges obsolete
- Length constant belts due to the application of high tensile steel cord tension members

BAT / BATK timing belts

„New profile shapes result in improved performance features“, this comment often describes the development possibilities of polyurethane timing belts. The curved tooth based on the proven AT profile forms the basis for the new BRECO® and BRECOFLEX® timing belts with curved teeth. The unique curved teeth guarantee notably improved transmission and running properties. On the one hand the BAT tooth has an increased load bearing capacity, on the other hand it does not abruptly run into the pulley gap but perfectly timed. Both features combined lead to an increased performance, clearly reduced running noise as well as a higher transmission precision and a lower vibration tendency. The belt centers itself on the pulleys in the stated preferred running direction due to the curved shape of the tooth which produces the self-guiding effect.

The **BATK** timing belt has ensued from the **BAT** timing belt. Compared to the BAT the BATK is provided with a guiding track resulting in a timing belt self-guiding in both running directions.

Timing belt guide of the BAT timing belt

The BRECO® and BRECOFLEX® timing belts with curved teeth have only one preferred running direction. In this direction the convex side of the tooth curve points in running direction of the drive. When observing this running direction the teeth laterally guide the belt also with large span lengths for which reason flanges are not required.

Even if the pulleys, tension and return rollers as well as their axes are perfectly aligned, we recommend a minimum span length of 5 times the belt width (see graphic) between the elements. This results in reduced lateral forces and the respective friction.

If tension and return rollers running on the teeth have a distance to their upstream pulley or roller exceeding 5 times the belt width (b), these rollers should be designed with teeth. If these elements are running on the back of the belt without teeth, flanges must be used (see graphic). Both measures lead to a better belt guidance and result in a high running performance.

BATK timing belts

For the BATK timing belt guidance by flanges is not required due to the teeth design. A wandering-off effect from the pulleys is excluded due to the guiding track.

Application fields

The BRECO® and BRECOFLEX® timing belts type **BAT** are suitable for all areas of the power transmission and transport technology, where high transmission precision, low variation tendency, smooth running and only one running direction are required. The BAT timing belt is self-guiding in its preferred running direction, thus, no guiding elements are required.

The **BATK** timing belt is mainly designed for application in the linear and power transmission technology.

BRECOFLEX® timing belts

BRECOFLEX: The BRECOFLEX® timing belt is manufactured in endless lengths without tension member interruption. The tension member is spirally coiled. BRECOFLEX® timing belts are universal applicable for all tasks in the drive technology up to 10000 min⁻¹.

Application areas

Endless timing belts for power transmissions

All drives designed for a high performance should preferably be produced as BRECOFLEX® timing belts with a full length steel cord tension member. They can be subjected to both permanent operation or for a start-brake characteristic. They operate in a rotational speed range of up to 10000 min⁻¹.

Endless timing belts are available in preferred catalog lengths. Our production range also permits the supply of intermediate lengths up to a maximum endless length of 20000 mm.

StandardPlus - BRECOFLEX® timing belts with improved properties

The new generation of BRECOFLEX® timing belts was special developed for high precision positioning applications. The use of the bifilar winding reduces the tendency of the belt to run off. The special way of winding prevents the formation of lateral forces resulting from the tensioned tension members inside the belt, which cause the timing belt to run off. In this manner, the friction forces in the drive are considerably reduced which leads to improve positioning properties.

Additional the new BRECOFLEX® timing belts achieve a notably improved pitch stability. The deviation of the tooth spaces could be further minimized.

With the new generation of BRECOFLEX® timing belts, the user is offered standard products which unite outstanding properties, such as high power transmission, high rigidity, optimized running behaviour and high precision.

Endless timing belt (Standard)
(with a full length tension member)

Endless timing belt (StandardPlus)
(bifilar winding, with a full length tension member)

Materials

BRECO® and BRECOFLEX® timing belts are manufactured according to standard in the material with the designation TPUST1 and steel cord tension members. Other materials e.g. for low or high temperature or for contact with food are possible. Likewise high flexible tension members (E) and tension members in stainless-steel are available. Our distribution partner advises you regarding our possibilities.

AT3	
Power transmission	≤ 5 kW
Rotational speed	approx. 20000 min ⁻¹
Peripheral speed	approx. 80 ms ⁻¹

Peripheral speed	approx. 48 ms ⁻¹
Synchronous pulley	from z=25
Applications (example)	power drives, paper-making machines, high-bay storage, lifting equipment

AT20, SFAT20	
Power transmission	possible beyond 200 kW
Rotational speed	approx. 6500 min ⁻¹
Peripheral speed	approx. 40 ms ⁻¹
Synchronous pulley	from z=18
Applications (example)	heavy-duty drives, textile machinery, printing machinery, machine tools

T10, L, H	
Power transmission	≤ 30 kW
Rotational speed	approx. 10000 min ⁻¹
Peripheral speed	approx. 60 ms ⁻¹
Synchronous pulley	from z=12
Applications (example)	machine tools, Main and subsidiary drives, textile machines, printing machinery

AT5	
Power transmission	≤ 15 kW
Rotational speed	approx. 10000 min ⁻¹
Peripheral speed	approx. 80 ms ⁻¹
Synchronous pulley	from z=15
Applications (example)	machine tools, pumps, textile machinery

BAT15, BATK15	
Power transmission	≤ 140 kW
Rotational speed	approx. 8000 min ⁻¹
Peripheral speed	approx. 48 ms ⁻¹
Synchronous pulley	from z=20
Applications (example)	power drives, pumps, sanding machinery

T5, XL	
Power transmission	≤ 5 kW
Rotational speed	approx. 10000 min ⁻¹
Peripheral speed	approx. 80 ms ⁻¹
Synchronous pulley	from z=10
Applications (example)	office machinery, do-It-yourself units, positioning and regulating drives

T20, XH	
Power transmission	up to approx. 100 kW
Rotational speed	approx. 6500 min ⁻¹
Peripheral speed	approx. 40 ms ⁻¹
Synchronous pulley	from z=15
Applications (example)	heavy construction machinery, paper machinery, pumps, compressors, textile machinery

AT10, BAT10, BATK10, SFAT10, ATK10K6	
Power transmission	≤ 70 kW
Rotational speed	ca. 10000 min ⁻¹
Peripheral speed	ca. 60 ms ⁻¹
Synchronous pulley	ab z=15
Applications (example)	construction machines, pumps, paper-making machines, compressors, textile machines, roller-table drives

ATP10	
Power transmission	≤ 100 kW
Rotational speed	approx. 10000 min ⁻¹
Peripheral speed	approx. 60 ms ⁻¹
Synchronous pulley	from z=15
Applications (example)	sanding machinery, power drives, machine tools

Remark:

Special timing belt designs allow the rpm and peripheral speed parameters to be increased.

SFAT15	
Power transmission	≤ 135 kW
Rotational speed	approx. 8000 min ⁻¹
Peripheral speed	approx. 48 ms ⁻¹
Synchronous pulley	from z=20
Applications (example)	construction machines, pumps, paper-making machines, compressors

ATP15	
Power transmission	possible beyond 200 kW
Rotational speed	approx. 10000 min ⁻¹
Peripheral speed	approx. 50 ms ⁻¹
Synchronous pulley	from z=20
Applications (example)	power drives, Machine tools

BRECO® timing belts (BRECO M: Open length / BRECO V: Joined belts)

BRECO M: The BRECO® timing belt is manufactured in open length. The tension members are always arranged with parallel edges. Open length is required e.g. in linear transmissions. All tension members assume part of the load.

BRECO V: BRECO® timing belts are manufactured from open length material welded to endless belts. In the join area the half number of tension members assume part of the load. The use of endless joined BRECO® timing belts is preferred in the conveying technology to handle any centre distance.

Application areas

Open length for linear transmissions

Rotary movements are converted into linear movements by linear transmissions. The BRECO® timing belt in its open length delivery form is preferably fitted to the machine part to be moved.

Joined belts for conveying drives

Endless joined timing belts without length limitation are available. The minimum length for various belt profiles, however, is to be taken into consideration. For special requirements in transportation timing belts are coated or manufactured with flights/profiles.

Joined BRECO® timing belt

Product separation

(pictorial schematic)

Timing belt lock for BRECO® timing belt

The BRECO® timing belt lock for the timing belt types AT10 DC and T10 DC is mainly used for low load drives but extensive assembly work. The lock offers substantial savings in work and costs where, for design purposes, the timing belt can only be joint to an endless belt after being inserted in the machine. It can also be used as an „Emergency belt“ to bridge downtimes as a result of malfunctions and belt failures. When using the lock for timing belts with flighted profiles, take a minimum profile spacing of 100 mm into account.

Technical data

Material of lock elements	Carbon fiber reinforced polyamide
Length of the lock (tooth center to tooth center)	90 mm
Number of connecting elements	10
Width of connecting plates	8 mm
Thickness of the timing belt (version DC)	5,5 mm
Minimum number of teeth of the pulley (use only normal gap)	25

Timing belt lock AT10 DC / T10 DC				
Available belt width [mm]	32	50	75	100
Admissible tensile force [N]	550	750	1000	1500

Ordering information

The lock elements on the belt rear are countersunk so that the elements are flush with the belt top edge. For this reason, the timing belt used must be thicker than the standard BRECO® AT10 or T10 timing belt. **Ensure that you specify the version as „DC“ when ordering an „AT10“ or „T10“ belt.**

Ordering examples

Ordering example for timing belts prepared for belt lock (belt-lock isn't assembled)
75 AT10 / 8400 DC oder 100 T10 / 6000 DC

Ordering example for timing belt lock
75 AT10 DC oder 100 T10 DC

Ordering example for timing belt with lock (belt lock is preassembled)
50 AT10 / 5400 DC assembled
50 AT10 DC assembled

Annotation:

Specify the two respective designations when ordering the timing belt and the lock. If only the timing belt designation is specified, only the timing belt will be supplied with the respective preparation for the lock.

AT10 DC timing belt lock

Timing belt guidance by flanges

Timing belts must be guiding to eliminate the lateral wandering-off effect. This is normally done by flanges.

Minimum lateral forces and low frictional losses can be resulted by the optimum arrangement of the belt guidance.

For this purpose, the following possibilities are available:

- Timing belt guidance downstream of a large free span length (infeed length (a) should not remain under 5 times belt width)
- Guidance at the drive pulley (to prefer for two shaft drives with short axis distance)
- Guidance of the pulleys with low power transmission (to prefer for multi shaft drives)
- Guidance on the tension rollers
 - Tension roller arrangement in the slack span side
 - With arrangement on the flush belt side: consider minimum diameter with contraflexure
 - With arrangement on the meshed belt side: Length of angle of wrap, min. 3 teeth
 - With changing rotational direction preferable in the span length centre
 - Condition: Minimum span length (a) between tension roller and pulley should not remain under 5 times belt width
- Ensure high axis parallelity and flush alignment of all pulleys to achieve optimum guiding features.
- For cost reasons it is possible to fit flanges also to the smaller pulley taking the functional reliability into consideration.

The utilisation of BRECO® and BRECOFLEX® timing belts with bifilar tension member arrangements is the ideal prerequisite for an optimal belt guide.

Tooth gap shapes

Timing belts are positive fitted drive elements. They work slippage-free with the respective synchronising pulleys. BRECO® and BRECOFLEX® timing belt drives can be optimised additionally for a movement transmission with a low flank backlash.

For some profiles and pitches, the SE or zero gap can be used for especially high requirements on the precision of the movement transmission. Please contact us for technical advice.

- Prerequisites for the application: Pitch matching between timing belts and pulley.
- Influencing factors of the pitch matching:
 - Pre-tension force
 - Meshing distance (z_p)
 - Load rate (rotational speed, dynamic behaviour...)
 - Manufacturing tolerances

Tooth gap shapes, see example T10

BRECOFLEX® timing belts can be applied as angular drives. Take into consideration that the timing belt can only be crossed (twisted). Eliminate the wandering-off effect.

$L_T/b \geq 20$
 $b =$ Belt width
 $L_T =$ span length

Angular drive with 2 axes

Angular drive with 3 axes

F_{adm} : Admissible tensile force
 F_U : For the drive remaining circumferential force
 F_S : Tensile force due to crossing

With crossed timing belt applications the outer tension members suffer a higher elongation as the inner ones. Due to the larger elongation in the edge zone the permitted proportional circumferential force for the belt in the tension members is reduced.

No power reductions or constructive special means are necessary at a ratio of $L_T / b \geq 20$. At a required ratio of $L_T / b < 20$ please contact our technical department for advise.

Safety factors

The width of a timing belt is correct when the permissible values for tooth shear strength, tension cord strength and flexibility are not exceeded under unfavourable operating conditions. In our catalog, load limits are stated which have been reliably proven and confirmed by bench tests and results obtained in practice. A safety factor is only required for drives with transmission into higher speed.

It is important, that the unfavourable load types occurring in the drive are known resp. correctly estimated by the engineer. With a positive fit transmission, even short-period overloads act via the timing belt being the drive member. Some instructions to this issue:

Rated operation

Design timing belts for the operating condition of the rated load. The rated load is the operating condition at which the drive should transmit the torque or the power at rated speeds under normal conditions.

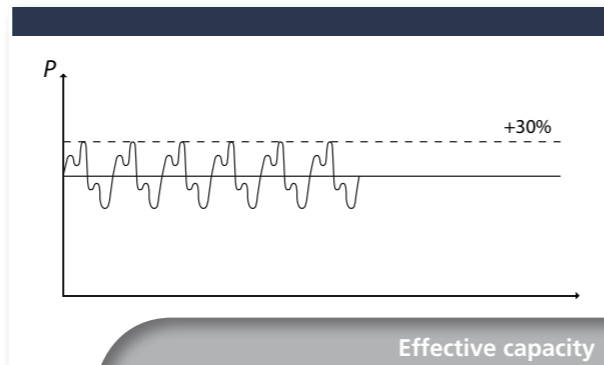

Start-up characteristics

- a) Drive side: The max. torque of the drive machine under start-up conditions is to be taken into consideration. The start-up torque, e.g. for three-phase squirrel cage motors amounts to 2 to 2.5 times the rated value.
- b) On the drive side: If necessary, „initial torques“ affective to the drive part timing belt are to be taken into consideration under start-up characteristics.

Check load case a) or b) with rotational speed $n=0$.

Brakes

It might have to be defined whether braking leads to loads which fully act via the timing belt and possibly exceed the type of load produced by the rated operation or the start-up characteristics. In the braking operation the torque reversal is to be taken into consideration.

Unevennesses (variations, impact shocks)

In addition to the rated load, superimposed vibration and impact shocks could act on the timing belt as the transmission member. For the illustrated example, increase the calculated belt width by the factor of 1.3.

Moments of inertia

Moments of inertia and/or centrifugal masses in the drives generally create a uniform running behaviour. Depending on the acceleration and deceleration characteristic it has to be differentiated and checked whether the moments of inertia create an additional load on the timing belt.

Step-up transmission

The following safety factors are to be applied for step-up transmissions:

$i = 0,66$ to $1,00$	$S = 1,1$
$i = 0,40$ to $0,66$	$S = 1,2$
$i < 0,40$	$S = 1,3$

In the braking operation may occur a torque reversal and the reduction can change into a step-up transmission.

Length tolerances for BRECOFLEX® timing belts

Pre-tension force

Pre-tension is intended to guarantee a minimum tensioning force at the slack span side to ensure smooth tooth meshing into the driven pulley.

Generally, the pre-tension should only be set as high as necessary. The necessary pretension force of the spans F_v depends on the max. circumferential force F_u , the belt length L_b (number of teeth z_b) and the drive configuration.

The recommendations shown in the table refer to the pre-tension force setting per span.

Drive configuration		Pre-tension force of each individual span
Two-shaft drive	$Z_b < 60$	$F_v = 1/3 F_u$
	$60 \leq Z_b < 150$	$F_v = 1/2 F_u$
	$Z_b > 150$	$F_v = 2/3 F_u$
Multiple-shaft drive	$l_{Load\ span} \leq l_{Slack\ span}$	$F_v = F_u$
	$l_{Load\ span} > l_{Slack\ span}$	$F_v > F_u$
Linear drive		$F_v \geq F_u$

In every case, the tension cord strength is the top limit of the span load. Take into consideration that especially with multiple-shaft and linear drives, an addition of the pre-tension force and the circumferential force in relation to the load span force is to be expected.

Influence variables

Stiffness of the belt

Friction forces created by the interaction of the tooth mesh (especially at the slack span) intensify the span forces, which in turn increase the degree of elongation. This influence may lead to the slack span tooth mesh butting against the driven pulley, thereby causing the belt to jump. Elongation being directly depending on the belt stiffness, the high stiffness of the steel cord tension members permits a comparably low pre-tension.

Circumferential force

The circumferential force acts in proportion to the elongation of the load span, i.e. excessive slackening of the slack span can be counteracted by a pre-tension matched to the circumferential force.

Belt length

Belt elongation resulting from the effect of the circumferential force and the friction forces is also approximately in proportion to the belt length. Therefore, the tendency of running up or jumping is considerably influenced by the belt length. Even under high circumferential forces with the resulting friction forces, a very short timing belt will elongate to only a small degree, so that even when subject to low pre-tension forces there will be no danger of running up or jumping of teeth. On the contrary, with short timing belts circumferential deviations of the pulleys could cause heavy pre-tension fluctuations and, as a result, extreme peak values.

Proportion of the span lengths

Especially with multiple-shaft drives the load span is often markedly longer than the slack span side. For this reason, a slight elongation of the load span results in a very unfavourable slack on the span side. Therefore, the pre-tension force of spans of such gearings should be higher than the circumferential force.

Precise transmission of movement

There is a high transmission accuracy possible in the reverse operation with BRECO® and BRECOFLEX® timing belts, when the span pre-tension forces are selected in the same size of the circumferential force.

Consequences of faulty pre-tension setting:

Too low pre-tension

- The teeth of the slack span side run up on or override the teeth of the driven pulley
- Wear on the faces caused by the friction force during meshing
- Forced breakage by excessive elongation due to full overriding

Excessive pre-tension

- High bearing load of the shafts
- Reduction of the transmission power
- Wear and tear at the belt tooth

General information

Design

- In the transmission configuration, design at least one adjustable axis, plan one adjustable tension roller (not spring-loaded) for fix centre distances
- The bearing has to be absolutely rigid
- Note the importance of a parallel run and flush alignment of the synchronising pulleys

Transport/storing

- Upon receipt, unpack the timing belt immediately and store in circular position in a dry place at room temperature
- Do not bend

Measuring with frequency measuring meter

The intrinsic frequency of a vibrating belt span can be measured by means of various Mulco belt tension measuring meters. The pre-tension force of the span can be calculated from the measured intrinsic frequency:

$$F_v = 4 \cdot m \cdot l_T^2 \cdot f^2$$

The corresponding intrinsic frequency can be calculated, if the pre-tension is preset:

$$f = \sqrt{\frac{F_v}{4 \cdot m \cdot l_T^2}}$$

f: Frequency of the variations in hertz:

m: Mass of the belt per meter length in kg/m

l: Drum span length subject to vibration in m

FV: Span force in N

Please contact our distribution partner for the various measuring meters. (e.g. BRECO® TSM alpha 1)

Mounting

- Fit timing belts on the pulleys when slack without exerting any force
- Exert no force when fitting with fix centre distances if necessary, fit together with synchronising pulleys
- Apply pre-tensioning force according to the chapter „Pre-tension“
- Secure adjustable axis against sliding
- Do not clamp the timing belt between the flanges

Operation

- Protect the drives against dust, dirt, hot surrounding media as well as acids and lyes
- Take into consideration the ambient temperatures (see characteristics of polyurethane timing belts)

Providing the following conditions of tooth strength (1st), tension member tensile strength (2nd) and flexibility (3rd) are met, then a maintenance-free timing belt operation can be expected.

1. Tooth shear strength
Specific tooth shear strength

The specific tooth shear strength depends on the rotational speed. The maximum specific tooth shear strength is the limit load the belt tooth can bear in continuous operation. The values are stated in tables for each timing belt type. The timing belt drive is correctly designed, when not exceeding the admissible tooth shear strength. Generally, a special safety surplus is not necessary, see chapter „Safety factors“.

The high specific tooth shear strength of the ATP profile, for example, is achieved by the optimised force and load distribution. The effective force is distributed to two tooth faces.

The working loads can be distributed the more effective the more belt teeth are meshing in the pulley. Maximum number of teeth in mesh (BRECOFLEX® timing belts): $z_{emax} = 12$

Due to the high pitch accuracy of BRECOFLEX® timing belts generally, it can be calculated with 12 belt teeth in mesh, should the number of teeth in mesh be respectively high enough.

2. Tension cord tensile strength
Admissible tensile load on belt cross section

The timing belt is designed correctly, when the maximum admissible tensile load in the steel cord tension members is not exceeded under operation conditions. The table values for F_{adm} refer to the constant loading.

3. Flexibility
Minimum number of teeth, minimum pulley diameter

The recommended minimum number of teeth and/or the minimum diameter for a malfunction-free operation depends on the selected belt type. Take especially into consideration that the minimum number of teeth and/or the minimum diameter is higher when using a belt arrangement „with contraflexure“ (e.g. due to a tension roller).

The selection of the minimum number of teeth and/or minimum diameter of the pulleys as well as tension and return rollers is based on a large number of different parameters. In the applications of the belt is to taken into consideration the belt versions and the flexibility of the tension members.

Acceleration torque	Load bearing torque		

Calculation power transmission

Task: A roll table drive must be designed for heavy conveying duties. Under start-up conditions the 2.5 times the running torque is exerted on the timing belt.

The application conditions are:

Given: Power $P = 10 \text{ kW}$
 Nominal speed $n = 800 \text{ min}^{-1}$
 Start-up torque $M = 300 \text{ Nm}$
 Transmission, number of teeth $i = 1, z = z_1 = z_2 = 25$
 Centre distance $a = 625 \text{ mm}$

Required: The timing belt pitch is to be determined and the belt width is to be designed.

Formulae:

$$b = \frac{100 \cdot M}{z_1 \cdot z_e \cdot M_{\text{spec}}} \quad M[\text{Nm}]$$

$$b = \frac{1000 \cdot P}{z_1 \cdot z_e \cdot P_{\text{spec}}} \quad P[\text{kW}]$$

$$F_U = \frac{2 \cdot 10^3 \cdot M}{d_0} \quad F_U [\text{N}]$$

$$d_0 = \frac{z \cdot t}{\pi} \quad [\text{mm}]$$

$$L = 2 \cdot a + z \cdot t \quad [\text{mm}]$$

How to proceed

Belt length: Profile preselection: AT10. Calculation of the belt length with formula:

$$L = 2 \cdot a + z \cdot t$$

$$= 2 \cdot 625 + 25 \cdot 10$$

$$= 1500 \text{ mm}$$

Calculation of the belt width: **1. Tooth shear strength**
 In the calculation it will be used $z_e = 12$ (see basis of calculation).
 Calculation of the belt width with the nominal speed of the power equations.

$$b = \frac{1000 \cdot P}{z_1 \cdot z_e \cdot P_{\text{spec}}}$$

$$= \frac{1000 \cdot 10}{25 \cdot 12 \cdot 6,96}$$

$$= 4,79 \text{ cm} = 47,9 \text{ mm}$$

Calculation of the belt width under start-up torque when rotational speed $n = 0$.

$$b = \frac{100 \cdot M}{z_1 \cdot z_e \cdot M_{\text{spec}}}$$

$$= \frac{100 \cdot 300}{25 \cdot 12 \cdot 11,70}$$

$$= 8,54 \text{ cm} = 85,4 \text{ mm}$$

The belt width is to be determined from the least favourable load conditions.
 Selected: the next larger standard belt width $b = 100 \text{ mm}$.

2. Tension cord strength
 The corresponding circumferential force can be calculated from the general data supplied:

$$F_U = \frac{2 \cdot 10^3 \cdot M}{d_0}$$

$$= \frac{2 \cdot 10^3 \cdot M}{79,58}$$

$$= 7539 \text{ N} < 16000 \text{ N}$$

The tabular value F_{adm} for AT 10 with 100 mm belt width is 16000 N. Thus, there is a sufficient tension member safety factor.

3. Flexibility
 The design is a drive „without contraflexure“. The minimum number of teeth according to the table is adhered to.

Result: The drive is correctly designed with a belt width of 100 mm. A maintenance-free operation can be expected.
 Ordering code: BRECOFLEX® timing belt 100 AT 10 / 1500

BRECO® and BRECOFLEX® timing belts used for transportation

Transport timing belts are to be designed preferably as head drive. The goods to be transported can consist of one or more individual loads. A lot of individual loads can be seen as line load.

Information on the force/elongation behaviour

The grid surface in the picture shows the force/elongation behaviour in the timing belt under operating conditions. The individual spacing between the transported products increase towards to the drive pulley assembly.

$$\text{Space } s_1 < s_2$$

Pre-tension force

We recommend to set the pre-tension force in the transport timing belt such that a residual pre-tension force is always maintained on the slack span side under operating conditions. The following pre-tension force is required:

$$F_v > 0,5 \cdot F_u$$

Calculation of the belt width b

$$b = \frac{F_u}{z_e \cdot F_{Uspez}} \quad F_u [N]$$

F_u : Circumferencial force (calculated)

F_{Uspez} : Specific load of the belt teeth

z_e : Number of teeth in mesh

z_{emax} : Maximum number of teeth in mesh for endless joined BRECO timing belts (V): $z_{emax} = 6$

Calculation of the circumferencial force F_u

From the overall transport load, the required haul-off force or the circumferencial force F_u for the drive pulley assemblies can be derived:

$$F_u = 9,81 \cdot m \cdot \mu$$

Circumferencial force in the drive pulley station	F_u [N]
Mass of the items to be transported	m [kg]
Friction factor of the timing belt in relation to the bed plate	μ

As friction factor μ (slide friction), the following values can be assumed:

Steel/PUR 92 Shore A	0,6 - 0,7
Steel/PAZ	0,2 - 0,4
PE/PUR	0,3 - 0,4

In general, friction factors show large ranges. Trials should be carried out, if necessary. Information without obligation.

Construction and properties

The most common output movement of electro-mechanical drives is the rotational movement. For the technical designer is the timing belt an ideal link in the kinematics. The timing belt transmits reliable, fast and directly rotational movements into linear motions. Travel speeds up to 10 m/s and any centre distances are possible. Within linear motions low position deviations are often required, e.g. in the handling technology (high precision of repeatability). We recommend our product range of BRECO® timing belts with the profiles AT and ATL. These polyurethane timing belts are designed and optimised for linear drives. They stand out for dimensionally stable teeth and stiffness of the belt spans.

Under extreme load and after a short run-in time, the pre-tension of the belts might slightly reduce by the tension members settling, making a once-only re-tensioning of the timing belt unavoidable. No post-elongation of the tension members is to be expected in continuous operation.

The timing belts are temperature resistant with ambient temperatures from -30°C to +80°C. Applications close to the limit temperatures (<-10°C and >50°C), however, might require adapted dimensioning. In this case please contact your distribution partner.

This catalog has been compiled to especially meet designers requirements. In this catalog you will find both the delivery range and all technical data required for the dimensioning linear drives.

Take into consideration corrections to the admissible load values, in case of deviations from the standard.

Construction

BRECO® timing belts are constructed of wear resistant polyurethane and high tensile steel cord tension members. Both materials combined form the basis for dimensionally stable and reliable BRECO® timing belts. An additional nylon tooth facing results in a low-friction timing belt with high performance.

The BRECO® timing belts is manufactured without length limitation. The steel cord tension members are arranged with parallel edges. The preferred delivery form is in rolls of 50 m or 100 m.

Properties

- Positive fit, synchronous run
- High loadability, length stable
- High degree of efficiency, max. 98 %
- Wear resistant in continuous operation
- Precision of repeatability of positioning in the linear system
- Pitch accuracy in the rotational to linear translation of movement
- Low mass, suitable for stepper drives
- Hydrolysis resistant, resistant against ozone and sun light
- Temperature resistant from -30° to + 80°C, temporarily higher
- Resistant to petrol, simple fats and oils

Construction features

Surrounding structure

Low friction and low dead weight is to be aspired for all assembly modules assuming part of the movement. The surrounding structure is to design dimensionally stable. Generally, BRECO® AT and ATL timing belts as open length are to be clamped on the moving linear technology using clamp plates.

BRECO® AT and ATL timing belts permit a rotational to linear translation of movement with continuous accuracy.

Due to the high pitch accuracy between belt and pulley meshing the load distribution is distributed equally to the tooth faces in mesh on the drive assembly pulley and that produces a high performance and accuracy. The choice of materials for the belt and pulley is especially suitable for bi-directional drives. The distance of travel per pulley revolution is defined with the selection of the pitch and the number of teeth of the drive assembly pulley. For the linear drives are three design versions available. (Please note chapter „Belt guidance“)

Linear slide

Linear table

Linear trolley

A dimensionally stable surrounding structure is to consider.

Coarse design

Determination of belt type and belt width

Example for the coarse design:

Mass of linear slide $m_L = 50 kg$
 Max. acceleration (w/o delay) $a = 20 m/s^2$

In the graph intersection point can be read:

BRECO® timing belt: AT 10 / ATL 10, 50 mm wide
 Alternatively: AT 20 / ATL 20, 32 mm wide

Recommendation:

The corresponding pulley of the drive pulley assembly should have 20 teeth (ATL=25) or more. With a pulley with less than 20 teeth (AT), select the next larger belt width.

Apply all equations with the dimensions mentioned here.

List of formulae, terms, definitions

Calculation

Belt width (formula 1)

$$b = \frac{F_t}{F_{tspez} \cdot z_e}$$

Torque

$$M = \frac{d_0 \cdot F_t}{2 \cdot 10^3}$$

Power

$$P = \frac{M \cdot n}{9,55 \cdot 10^3}$$

Circumferential force (formula 2)

$$F_t = \frac{2 \cdot 10^3 \cdot M}{d_0}$$

Calculation value

Tangential force	F_t [N]
Torque	M [Nm]
Power	P [kW]
Diameter	d_0 [mm]
Belt width	b [cm]

Maximum number of teeth in mesh for BRECO® timing belts (M): $z_{emax}=12$

Angular speed

$$\omega = \frac{\pi \cdot n}{30}$$

Linear and rotary motion

Rotational speed

$$n = \frac{19,1 \cdot 10^3 \cdot v}{d_0}$$

Travel time when $v = \text{const.}$

$$t_v = \frac{s_v}{v \cdot 10^3}$$

Travel distance when $v = \text{const.}$

$$s_v = v \cdot t_v \cdot 10^3$$

Overall time

$$t_{tot} = t_B + t_v + t'_B$$

Overall distance

$$s_{tot} = s_B + s_v + s'_B$$

(formula 3)

Speed / peripheral speed

$$v = \frac{d_0 \cdot n}{19,1 \cdot 10^3} = \sqrt{\frac{2 \cdot s_B \cdot a}{1000}}$$

Acceleration time (braking time)

$$t_B = \frac{v}{a} = \sqrt{\frac{2 \cdot s_B}{a \cdot 1000}}$$

Acceleration distance (braking time)

$$s_B = \frac{a \cdot t_B^2 \cdot 10^3}{2} = \frac{v^2 \cdot 10^3}{2 \cdot a}$$

$$F_t = \text{Acceleration force (1st)} + \text{Lifting force (2nd)} + \text{Frictional force (3rd)}$$

$$= m \cdot a + m \cdot g + m \cdot \mu \cdot g$$

Required tangential force at the pulley F_t [N]

- (1.) The acceleration force F_B is necessary to accelerate the linear drive with mass m e.g. from the stand still to the limit speed v .
- (2.) The lifting force F_H is necessary with a movement direction opposite to the acceleration due to gravity. With horizontal linear - movement is $F_H = 0$.
- (3.) A friction force is required when opposite to the moving direction a force is taking effect, e.g. friction force. Can the frictional drags be neglected is $F_R = 0$.

(formula 4)

List of formulae, terms, definitions

Berechnung

m_L [kg]	Mass of the linear slide to be moved
m_B [kg]	Mass of the timing belt (belt weight, see technical data)
m_{zred} [kg]	Reduced mass of the pulley(s)
m_{sred} [kg]	Reduced mass of the tension roller(s)

$$m = m_L + m_B + m_{zred} + m_{sred}$$

(formula 5)

The mass of a pulley and/or tension roller is calculated in relation to:

$$m_z = \frac{(d_k^2 - d^2) \cdot \pi \cdot B \cdot \rho}{4 \cdot 10^6}$$

$$m_s = \frac{(d_s^2 - d^2) \cdot \pi \cdot B \cdot \rho}{4 \cdot 10^6}$$

Mass of the pulley m_z [kg]

Mass of the tension roller m_s [kg]

The reduced mass m_{zred} of a pulley and/or tension roller is an equivalent mass with equal load bearing to the effective line of the timing belt, the same as the rotational solid to the rotational axis.

Reduced mass of the pulley m_{zred} [kg]
Reduced Mass of the tension roller m_{sred} [kg]

$$m_{zred} = \frac{m_z}{2} \left[1 + \frac{d^2}{d_k^2} \right]$$

$$m_{sred} = \frac{m_s}{2} \left[1 + \frac{d^2}{d_s^2} \right]$$

(formula 6)

A linear drive is pre-tensioned correctly, when under maximum effective tangential force F_{tmax} (from acceleration and braking) the slack span side of the belt stays tight. A minimum pre-tension force is to be considered:

Pre-tension force F_{TV} [N]

$$F_{TV} \geq F_t$$

(formula 7)

The highest span forces F_{Tmax} are to be expected within the tight span side, when both pre-tension force F_{TV} (static) and tangential force F_t (dynamic) acting together.

Maximum span force in the belt F_{Tmax} [N]

$$F_{Tmax} = F_{TV} + F_t$$

(formula 8)

The admissible tensile load F_{Tadm} has to show always safety factors to the max. occurring span force F_{Tmax} in the timing belt. (F_{Tadm} see Technical Data)

Admissible span force F_{Tadm} [N]

$$F_{Tadm} \geq F_{Tmax}$$

(formula 9)

The static centre/axis load F_{Astat} act within the stand still or under no-load conditions. F_{Adyn} is a value depending on the effective circumferential force.

Centre force [N]

$$F_{Astat} = 2 \cdot F_{TV}$$

(formula 10)

List of formulae, terms, definitions

List of formulae, terms, definitions

$\Delta l = \frac{F_{TV} \cdot L_B}{2 \cdot c_{spec}}$	Linear slide
--	--------------

$\Delta l = \frac{F_{TV} \cdot L_B}{c_{spec}}$	Linear trolley
--	----------------

$\Delta l = \frac{F_{TV} \cdot L_B}{c_{spec}}$	Linear table
--	--------------

The tensioning station can be mounted at any position on the timing belt. Values for c_{spec} see technical data.

$c = \frac{L_B}{L_1 \cdot L_2} \cdot c_{spec}$	$L_B = L_1 + L_2$
--	-------------------

Linear systems show a variable elasticity. The elasticity behaviour of the linear slide and/or linear bed depends on the length proportion L_1 and L_2 .
That means: Each individual position of the linear bed has its own elasticity.
The elasticity shows a minimum c_{min} , when L_1 and L_2 are equal in length.
For this case the following relation is valid:

$c_{min} = \frac{4 \cdot c_{spec}}{L_B} \text{ bei } L_1 = L_2$

Is an external force acting on a linear slide a positioning deviation s results Δs from the relation:

$\Delta s = \frac{F}{c}$

Under the effect of a triggered force, a mass connected to the timing belt (elasticity/mass system) assumes a damped natural vibration.

$f_e = \frac{1}{2\pi} \sqrt{\frac{c \cdot 1000}{m_L}}$
--

If necessary, check linear drives with regard to the occurrence of excitation frequencies f_0 in the drive pulley assembly which are close to the natural frequency f_e .
For technical structures, avoid compatibility of $f_e = f_0$ (resonance).
Note: In linear drives, the natural frequency f_e is in general considerably higher than the excitation frequency f_0 of the drive, in which case no resonance is to be expected.
We recommend a special examination, if necessary, where stepping motors are used.
Measures in the event of resonance: Increase the stiffness of the timing belt by choosing a larger belt width.

How to proceed

The above mentioned equations can be used to comprehensively compute BRECO® linear drives. The type of the individual examinations depends on the task. If necessary, request technical support from our sales outlets.

General kinematics

If the movement sequence of the linear drive has to be timed, we recommend to proceed in accordance with the linear movement values of the equations (3).

Coarse design
according to mass and acceleration

Generally, the mass of the linear slide m_L and the acceleration a represent the decisive values for the design of linear drives. On page 152 the belt type and timing belt width can be determined, based on mass and acceleration after the selection diagram.
In conjunction with the coarse design, we recommend to adopt the pulley dimensions (as a provisional measure). Note the permissible minimum number of teeth or minimum diameters.

The drive station

The required tangential force F_t in the drive pulley assembly has to be determined according to equation (4). By provisionally assuming the pulley size, it is possible to calculate the attendant drive torque M according to equation (2) for the drive pulley assembly. In how far the calculated torque M can be harmonised with the torque sequence of the motor, depends on the type and selection of the drive motor. The selection of the motor also depends on the desired servo and positioning tasks. Once the drive motor has been decided upon, the actual torque sequence of the motor has to be taken into consideration for the further precise design of the timing belt.

List of formulae, definitions

Belt width calculation
Precise design to tooth shear strength

For the calculation of the belt width the actual torque characteristic of the drive motor - from drive or brake - is to be used. At first the maximum motor torque according to formula (2) is to be converted to the respective circumferential force F_t . From the calculated tangential force the minimum width of the timing belt, according to formula (1) can be calculated.

$$b = \frac{F_t}{F_{t\text{spec}} \cdot z_e} \quad [\text{cm}]$$

The result of the calculated belt width (b in cm) is the required belt width for transmit the tangential force F_t via the meshing teeth from the pulley to the belt (or reverse). The calculated belt width is to be rounded-up to the next larger standard belt width.

Check of tensile load

Check the tensile loads for the calculated belt width, which become effective due to the pre-tension force F_{TV} according to formula (7) and the overlapping tangential force F_t according to formula (8). The max. permitted tensile loads according to formula (9) must not be exceeded. If necessary, select the next larger belt width.

Safety factors

Special additional safety factors are not necessary for the BRECO® timing belt. When, however, in addition to the maximum tangential force $F_{t\text{max}}$ are to be expected unevennesses, variations or impact shocks, which are not yet considered in the design, any additional safety factors can be added to the belt width.

Accuracy
in the rotational to linear translation of movement

The BRECO® timing belt transmits rotational movements into the corresponding linear motions via the pulley of the drive station. The procedure can be repeated as often as required and is a continuous operation with BRECO® timing belts. Deviation from the linear line can occur due to different forces and tolerances. The following is a description of causes and measures to be taken.

1. Precision of repeatability

The term repeatability of a linear drive implies the capability of regaining a position once accessed under the same conditions. In linear systems, repeatabilities of notably less than +/- 0.1 mm per metre of path travelled can be achieved with BRECO® AT timing belts. Prerequisite for a consistent repeatability is the retaining of the minimum pre-tension force according to the equation (7).

2. Positioning precision

The term positioning precision of a linear drive is the capability to convert the turning angle of the pulley into the attendant setpoint linear path via the timing belt. The achievable actual linear path depends on the active forces and of the tolerances of all assembly groups involved in the sequence of movement. Measures: Individual measures according to the following points 3 - 8 are to be applied, depending on the dominating values.

3. Stiffness / force-extension behaviour

If varying forces act on the linear unit, a correspondingly different elongation becomes effective. The corresponding "specific elasticities" are indicated in the Technical Data for steel cord tension members.
Measures: Plan a wider timing belt to keep the elongation small. The positioning deviation resulting from the elongation behaviour can be calculated with the equations (12) and (13). A dimensionally stable surrounding structure is to consider.

List of formulae, definitions

4. Inverse fault

When a linear position is moved to from a different direction, an inverse fault could occur in relation to the desired position. In other words: If the forces acting on the linear unit inverse, an inverse fault could occur.
Measures: Design linear guides and the entire system such that low friction occurs. Design the pulley of the drive pulley assembly with a narrower tooth gap or with a „0“ tooth gap. Normal requirements with regard to the positioning precision are reached with the standard tooth gap. For the use of special tooth gaps, please ask for our technical support.

5. Length tolerance Pitch deviation

A length tolerance in the timing belt leads to a pitch deviation. In this case, all pitches remain identical in relation to each other. Once installed, amongst others, a length tolerance/pitch deviation depends on the pre-tension applied. The length tolerance/pitch deviation is available in pre-defined ranges, due to the production method.
Measures: Use BRECO® timing belts in the minus tolerance range, and pre-tension to the setpoint dimension once installed. Ask for our specialist support.

6. Pitch faults

The term pitch faults defines irregularities of neighbouring pitches. Pitch faults have no cumulative effect within one belt section.
Measures: Design the pulley of the drive pulley assembly as large as possible. The larger the number of teeth meshing in the pulley, the more efficient pitch errors are suppressed.

7. Eccentricity fault Centre offset

The eccentricity fault and/or centre offset of at least one pulley or tension roller involved can lead to an irregular movement in the linear system. This type of fault should be assumed when sinusoidal movements occur in the linear movement sequence.
Measures: Check the concentric precision and the centre offset.
Reduce the tolerance range, if necessary.

8. Ambient temperature Elongation under heat

The linear elongation under heat of the BRECO® timing belt with steel cord tension members shows the same values as the linear elongation under heat of a surrounding steel structure. No change of the pre-tension force is then to be expected. In the case of a surrounding aluminium structure and a rise of the ambient temperature, a slight increase of the pre-tension can be expected. The attendant linear path changes with the linear elongation behaviour under heat of the surrounding structure.
Measures: The influence of elongation under heat in the belt and also in the surrounding structure are minor. Temperature influences only need to be taken into account in exceptional cases.

User information

Part of the offered formulae contain simplified assumptions.
E.g. calculation of the positioning deviation according to equations (12) and (13): The elongation behaviour of the tension member is also taken into account in the area of the pulley angle of wrap. However, the elasticity of the belt tooth has been neglected.
E.g. the vibration behaviour according to equation (14):
Only the vibrating mass m of the linear slide m_l is taken into account. The vibrating mass of the timing belt, the pulleys as well as the retroaction of the elasticity to the surrounding structure have not been taken into consideration.

For this reason, we point out that corresponding deviations have to be expected, depending on the drive geometry selected.

Information

Available worldwide around the clock.

Ordering a standard size by way of a code guarantees the delivery of a product meeting the ensured properties.

All information contained in our product range refers to the standard types.

Please contact your competent distribution partner for further information regarding technical data, tolerances, calculations and special purpose belts.

Quality products, first-class advice and individual service are part of the standard package for all members of Mulco Europe EWIV. This standard is constantly being upgraded and adapted to the needs of the customers.

The „belt pilot“ is an online tool which allows design engineers all over the world to work round the clock on design solutions for timing belt drives. They can carry out geometric calculations to configure the belt drive, decide on the number of teeth, plan the belt width or calculate the pulley diameter, save the configured drive or open calculations already saved, or use the performance calculation to check the possibility of using the selected timing belt with the load data - the „belt pilot“ has the versatility and wide range of calculation options to help them find the right solution quickly.

The CAD download facility enables users to transfer timing belts and components to their own CAD system as CAD drawings. 2D or 3D CAD drawings in a wide and diverse range of file formats are user-definable and can be copied directly into CAD programs.

To find the „belt pilot“ visit www.mulco.de

Great Britain

BRECO insists on high quality not only in its manufacturing processes but also in the standard of its advice and service in everything to do with polyurethane timing belt technology. Our distribution partners are all specialists in this field who themselves offer first-class customer service.

BRECO is a member of Mulco Europe EWIV, a European Economic Interest Grouping (EEIG). All the members of this group are considered pioneers in the field of polyurethane timing belt technology. The trust which has evolved over many years and the intensive cooperation have been and will continue to be the basis for innovative power transmission solutions in mechanical engineering in general.

BRECO® and BRECOFLEX® timing belts - staying safely on the move.

Available product catalogues - for every application the right product

BRECO® and BRECOFLEX® timing belts

- General information (application and calculation notes)
- Endless timing belts (BRECOFLEX®)
- Open length timing belts (BRECO® M)
- Endless joined timing belts (BRECO® V)
- Timing belt lock for AT10, T10

ATN-System - BRECO® timing belts for transport technology

- ATN timing belts
- ATN timing belt lock
- ATN standard profile connection
- ATN profiles
- ATN components
- Application and calculation notes

BRECO® and BRECOFLEX® flat belts

- General information
- Endless flat belts (BRECOFLEX®)
- Open length flat belts (BRECO® M)
- Endless joined flat belts (BRECO® V)

Finishing of timing belts

- Coatings for polyurethane timing belts
- Mechanical rework of coatings
- Mechanical rework of timing belts
- High strength profile connection
- Welded-on profiles

BRECO® und BRECOFLEX® Components

- General information
- Timing Pulleys
- Synchronizing shafts
- Synchronous pulleys with tensioners
- Tension rollers
- BRECO® fix-clamping elements

Warranty

All information was compiled with utmost care according current knowledge. We wish to stress that the technical data is subject to tolerances and not intended to be understood as a delivery specification. We further emphasise the fact that the section 'Calculations' and their application implies development risks.

No claims can be derived from possible errors or false application interpretation. All rights for technical modifications are withheld.

BRECO® and BRECOFLEX® are registered trademarks of BRECO Antriebstechnik Breher GmbH & Co. KG.
